

# Cable Fitting Instructions For Cardale Mk2 Spring Drum

1. Ensure that one cable is still attached to the spring drum unit and that there is still tension on the spring
2. Lock the tension on the spring drum unit. This is done by pulling on the existing cable until the holes in the centre part of the spring unit line up with the holes in the outer bracket, then insert a 6" pin or nail through the holes and slowly release the cable
3. Take the cable (loop first), thread it over the small corner pulley, down the back of the link arm. Undo the bottom screw in the track, place looped end of the cable over the nylon roller and onto the spindle. Replace the screw in the track
4. Take the other end of the cable and place it around the centre pulley and into the slot. Ensure the cable is over the corner pulley, pull on both cables and remove the 6" pin or nail, letting the cables back slowly making sure they are in the two grooves around the pulley

## SAFETY NOTE

Safety glasses and gloves should be worn at all times. If in doubt, this work should be carried out by an experienced installer.

All work is undertaken at your own risk.
